## Moderation of Coastal Climates

Via Energy Transport Via Heat Sink

#### Oceans as Energy Transporters: Warm Currents

- <u>Oceans move energy via</u> currents.
- Warm Currents:
  - An ocean <u>current</u>
    <u>beginning near</u> the
    <u>equator moves warm</u> <u>water</u>.
  - When <u>warm water</u> moves <u>in</u>to an <u>area</u>, the local <u>air</u> <u>temperature increases</u>.

#### Oceans as Energy Transporters: Cold Currents

- Oceans move energy via currents.
- Cold Currents:
- An ocean <u>current</u>
  <u>beginning near</u> the
  Earth's <u>poles moves cold</u> water.
- calinea
- When <u>cold water</u> moves <u>in</u>to an <u>area</u>, the local <u>air</u> <u>temperature</u> <u>decreases</u>.

### Oceans as Energy Transporters: Example

- The <u>NC coast</u> is <u>warmer than</u> the <u>California</u> <u>coast at</u> the <u>same latitude</u> because ...
- <u>NC</u> is <u>next to</u> the <u>warm Gulf Stream</u> moving up <u>from</u> the <u>equator</u>.
- <u>CA</u> is <u>next to</u> the <u>cold California current</u> moving down <u>from Alaska</u>.

# **Oceans as Heat Sinks**

- Heat sinks . . .
  - are objects/substances that <u>store large</u> <u>amounts of energy</u>.
  - <u>have</u> a <u>high specific heat capacity</u>.
  - Specific heat capacity = amount of energy needed to raise the temperature of the substance.
  - High specific heat capacity = heats up slowly & cools down slowly.
     Low specific heat capacity = heats up quickly & cools down quickly.

### Heat Sinks and Climate: Temperature Change

- Water = very high specific heat capacity
- <u>Oceans slow</u> the rate at which <u>coastal</u> areas experience <u>temperature changes</u>.
  - <u>Winter:</u> temperature at <u>NC Outer Banks</u> <u>drops</u> <u>slower than</u> in <u>Raleigh</u>.
  - <u>Summer:</u> temperature at <u>NC Outer Banks</u> rises slower than in <u>Raleigh</u>.

## Heat Sinks and Climate: Temperature Moderation

• Since <u>oceans</u> provide a <u>constant source and</u> <u>sink for energy</u>, <u>coastal temperatures</u> tend to stay <u>steadier than inland</u> temperatures.
